

I am concerned that widespread use of BPL technology will cause significant interference to important radio services that use the HF spectrum. These services, which provide important public service and homeland security functions, rely on reception of relatively weak signals. Tests have shown that signal "leakage" from nearby BPL systems is more than enough to render some of these HF services useless.

Placing the burden on the victims of interference is not the right approach. I urge the FCC not to extend BPL beyond the current Part 15 limitations.
